

Steaming sheets

For disinfection of soil

Vaporex® steaming sheets

Steam is often used for disinfection of soil for cultivation. In order to make optimal use of the steam, it is important to make sure that the steam can penetrate the soil as effectively as possible. For this purpose Genap supplies Vaporex® steaming sheets. Due to possible bulge forming and shrinkage of the sheet, it is important to order sheets 10% larger than the area which needs to be disinfected (or the roof length).

Material

Genap has developed the heat resistant Vaporex® 2800 PVC foil specially for steaming soil. Standard widths: 2, 4, 6 and 8 m or a multiple of 1 m.
